Channel Products' Remote Ignition Devices Feature Remote Power Source, a Variety of Voltages and a New Compact Design

CHESTERLAND, OHIO ó August 2009 ó Channel Products' remote ignition devices with remote power source, a variety of voltages and a new compact design permits users to initiate a spark from a remote location without being attached to the power grid.

The remote ignition devices are available in outputs from one through six ignition points with igniters in four different voltages. They now come in 1.5-volts, 3-volts, 9-volts and 12-volts. The devices also come equipped with a remote power source allowing the users to ignite without being attached to a wall power source.

The new compact design is 40 percent smaller than previous Channel Products offerings, making it convenient and efficient for users. The product can also be mounted in two orientations making it more flexible for the user.

“Channel Products' remote ignition devices offer a new compact design and a variety of voltages making them a high quality option for applications such as ranges, RV applications and BBQ grills,” said Steve Hussell, director of marketing and sales, Channel Products.

Re-ignition systems sense flame and begin sparking to relight the burner when flame is no longer detected. These products can be used on kitchen range tops, agriculture heaters, RV appliances and BBQ grills.

In business for more than 30 years, Channel Products Inc. is a leading manufacturer of high-value, innovative ignition and control products. The company manufactures electronic and piezoceramic igniters, gas ignition safety controls, electrodes and sensor assemblies, wire assemblies and accessories.
